Subjective:

Date of Visit: 4/12/2024

Chief Complaint: Follow-up healed left fifth metatarsal base fracture, zone 1, sustained on 9/5/2023, left peroneal neuritis.

HPI:

Hilda Lemus is a 56 y.o. year old female who presents for follow-up of the above diagnosis. Since her last clinic visit, she completed the Medrol Dosepak and has been taking her gabapentin for the left peroneal neuritis. She states that while she was taking the medication, her symptoms did improve, but upon completion her pain has now returned. She states the pain starts in her left low back and runs all the way down the leg towards the foot. She states most of her pain is centered around the outer aspect of the left knee. She states that the prolonged standing she has to do at work significantly worsens her pain. She states that that when the pain is really bad, it causes some numbness about the lower leg. She denies any new injuries or falls and is here today for reevaluation and discussion of her treatment options moving forward.

Allergies:**Allergies****Allergen**

- Naproxen
- Tramadol

Reactions

Anaphylaxis
Other

Outpatient Meds:**Current Outpatient Medications:**

- gabapentin (Neurontin) 300 MG capsule, Take 1 capsule (300 mg total) by mouth in the morning and 1 capsule (300 mg total) at noon and 1 capsule (300 mg total) in the evening, Disp: 90 capsule, Rft: 0
- levothyroxine (Synthroid, Levoxy) 50 MCG tablet, Take 1 tablet every day by oral route before meals for 90 days, Disp: Rft:
- methylPREDNISolone (MEDROL, PAX) 4 MG tablets, Follow schedule on package instructions, Disp: 21 tablet, Rft: 0

Review of Systems:

10 point review of systems reviewed with the patient and otherwise negative unless stated in the HPI.

Objective:**Vital Signs:**

There were no vitals taken for this visit.

Physical Exam:

General: Alert and oriented. No acute distress.

Skin: Normal for ethnicity, no bruising or discoloration, warm dry, intact.

MSK: The patient arrives ambulatory with a steady gait in a pair of close toed shoes. Neutral foot alignment upon standing with no noted deformity or swelling. There is no tenderness at the base of the fifth metatarsal nor with metatarsal stressing. She is sensitive to palpation diffusely along the peroneal nerve distribution with a positive Tinel's at the proximal fibular head. She also does have reproducible pain along the sciatic nerve distribution with single limb rise. Dorsiflexion and resisted eversion remain intact but reproduces pain. No noted laxity in anterior drawer test. No other tenderness noted to the forefoot, midfoot, or hindfoot with palpation or manipulation. Sensation is intact to light touch at superficial peroneal, deep peroneal, tibial, sural, and saphenous nerves. 2+ dorsalis pedis, 2+ posterior tibialis.

Radiographs:

3 view weightbearing x-ray of the left foot reveals a well-healed fifth metatarsal base fracture. Joint spaces are overall well-preserved.

Procedures:

Procedures

Assessment:**Impression:**

Hilda was seen today for pain.

Diagnoses and all orders for this visit:

Closed displaced fracture of fifth metatarsal bone of left foot with routine healing, subsequent encounter (Primary)

- XR foot 3+ views left; Future

Peroneal neuritis, left

- gabapentin (Neurontin) 300 MG capsule; Take 1 capsule (300 mg total) by mouth in the morning and 1 capsule (300 mg total) at noon and 1 capsule (300 mg total) in the evening.

Acute left-sided low back pain with left-sided sciatica

Plan:

Plan: The images, pathophysiology and plan of care were extensively discussed with the patient today via the language line interpreter computer. She did have a positive response to the Medrol Dosepak and gabapentin given to her during her last clinic visit for peroneal neuritis. I explained that she is likely having

Lemus, Hilda (MR # 4732360)

4/15/24, 11:41 AM

Lemus, Hilda (MRN 4732360) DOB: 11/27/1967 Encounter Date: 04/12/2024

this irritation of the peroneal nerve along with low back pain with radiculopathy from the prolonged use of a boot after her injury. This boot causes an uneven gait mechanics which can exacerbate the symptoms she is experiencing. Today I extensively discussed treatment options and I recommend initiating formal physical therapy where they can work on range of motion, strengthening exercises and gait mechanics. I explained that they will have to work both on the left lumbar back pain with radiculopathy and peroneal neuritis. We also discussed a diagnostic and therapeutic perineural steroid injection around the common fibular nerve at the location of the proximal fibular head. I explained that this will be diagnostic and therapeutic in nature especially given she is now 7 months out from her injury. I recommend at least 4 to 6 weeks of physical therapy prior to reevaluation. She can continue with activities as tolerated by her symptoms. All questions were answered and they are in agreement with the plan of care.

I spent >30 minutes in taking care of this patient including obtaining history, performing physical exam, reviewing prior charts and test results, documentation, counseling and co-ordination of care.
